Image Sensors in TKH Vision Cameras

Wavelength Spectrum & Resolution

UV

ULTRAVIOLET WAVELENGTH

Cameras for the near and mid-UV range between 200 nm and 400 nm are used in many industrial and scientific imaging applications. They are particularly suitable for detecting smallest surface defects, cracks, or irregularities in materials, such as semiconductors, glass, metal, or plastic, invisible to the human eye. But they are also important to qualify laser beams, to capture specific spectral material characteristics, or for detecting corona discharges of powerlines allowing for proactive maintenance and reducing the risk of power outages.

Our cameras featuring the IMX487 8MP UV sensor from Sony enable high-resolution UV imaging with low noise at high frame rates, making it possible to reveal smallest in-visible details and to speed-up processes.

Polarizer

POL

POLARIZED WAVELENGTH

Cameras equipped with Sony IMX Polarsens sensors (IMX250/253/264) offer a valuable advantage in polarized imaging, as they can eliminate the need for additional polarizer filters on the lens, making it easier to adapt to various polarization angles without changing or rotating optical polarization filters.

By using polarized image data difficult imaging tasks can be solved, as for example, minimizing obstructing reflections during surface inspections, enhancing contrast to detect shapes and details of (e.g., black) objects with low contrast, or detecting various material properties such as stress, composition, or surface structure.

With our Polarizer cameras you can simplify your polarized imaging setup and focus on capturing high-quality images.

## Infrared Imaging

In everyday life, we are constantly exposed to electromagnetic radiation differing in wavelengths such as visible light, ultraviolet light, radio and microwaves, or X-rays. Within the electromagnetic spectrum, infrared radiation is in the range between visible light and microwaves.

It covers a wavelength range from 0.75  $\mu\text{m}$  – 14  $\mu\text{m}$  and is separated into near-infrared (NIR), short-wave infrared (SWIR), mid-wave infrared (MWIR), and long-wave infrared (LWIR).

Although infrared radiation in the SWIR region is not visible to the human eye, it interacts with objects in a similar manner as visible light. Thereby, SWIR cameras have the advantage to "see" even at night and under challenging conditions such as fog, haze, or smoke. Another major benefit of SWIR cameras, is their ability to image through glass, making special and often expensive lenses unnecessary as they are required for MWIR or LWIR imaging.

## InGaAs Sensor Technology

InGaAs sensors are in several aspects different to monolithic silicon-based sensors. For example, InGaAs sensors:

- consist of two layers - a light-sensitive InGaAs layer and a Silicon-based readout integrated circuit (ROIC).
- have typically more defective and non-uniform pixels, requiring appropriate image correction functions in the camera.
- have a significantly higher dark current, requiring sensor cooling to reduce image noise and enable longer exposure times. For this reason, many sensors are equipped with thermoelectric cooling (TEC) elements.

Left: Bump connection; Right Cu-Cu connection (IMX99x sensors)

## Extended Spectral Range

InGaAs sensors with an extended spectral range can also detect wavelengths above 1.7  $\mu\text{m}$ . This makes it possible, for example, to capture unique spectral material properties, which is particularly advantageous for sorting applications or for determining material concentrations in composite materials. The most important areas of application therefore include: waste recycling (e.g. plastic sorting), the detection of water content or moisture, and the identification of foreign bodies or contaminants in mixtures.

## SenSWIR sensor technology

Sony's InGaAs SWIR sensors with SenSWIR technology enable imaging of wavelengths from 0.4  $\mu\text{m}$  to 1.7  $\mu\text{m}$ . The broad spectral range enables users to capture images with high quantum efficiency in the visible as well as the SWIR spectrum with a single camera, reducing overall system costs.

The innovative architecture of the digital InGaAs sensors allows pixel sizes of only 3.45  $\mu\text{m}$  and provides a high image homogeneity due to their copper-to-copper interconnects. The small pixel size is particularly important for SWIR applications with high resolution and precision, such as semiconductor inspection or quality of optics for laser-based measurement systems.

Applications

> Food & Beverage

- Food Sorting and Grading
- Package Inspection
- Fill level Detection
- Liquid Inspection

> Agriculture & Smart Farming

- Growth Monitoring
- Drones
- Humidity Measurement
- Field Analysis

> Security & Traffic

- Surveillance
- Vision Enhancement
- Night Vision

> Spectral Imaging

- Hyperspectral Imaging
- Multispectral Imaging
- Material Classification
- Contamination Detection

> Scientific & Medical

- OCT
- Microscopy
- Cancer Detection

> Semiconductors & Electronics

- Wafer Inspection
- Display Inspection
- PCB Inspection
- Subsurface Inspection

> Laser Beam Profiling

- Laser Beam Analysis
- Stability of Laser Signals
- Monitoring of Beam Parameters

Cameras

> Alvium Alvium C/U/G1/G5

- Very compact (29mm x 29mm x L), light weight, energy-efficient, and affordable (SWaP+C) camera solution
- High modularity including board-level versions (Flex & Frame) and sensors with removed cover glass
- Support of all TEC-less IMX99x SenSWIR, UV (IMX487), and 5MP Polarsens (IMX264/250) sensors
- Multiple standardized interface options including CSI-2 range extenders FPD-Link III
- 512 MB Burst Mode buffer (5GigE)
- GenICam-compliant feature control and streaming
- Extended feature set including sequencer, convolution filters, or lens shading compensation
- Plug & Play application setup
- Extended temperature range from -20°C to +65°C (housing)
- General Purpose (GigE modes) Inputs/Outputs (GPIOs) opto-isolated inputs

> Goldeye/ Goldeye Pro

- Multi-purpose SWIR camera series with two housing designs: compact industrial (55mm x 55mm x 78mm) and advanced scientific (90 mm x 90 mm x 80 mm)
- Support of numerous InGaAs sensors with TEC1 or TEC2 cooling including IMX99x sensors
- Models with strong sensor cooling down to -30°C for long exposure times or eXtended SWIR sensitivity up to 2,200nm
- Standard compliant interfaces, as GigE Vision & Camera Link (Goldeye) or 5GigE Vision (Goldeye Pro)
- 256 MB SDRAM (Goldeye) / 512 MB DDR4 RAM (Goldeye Pro) image buffer
- Advanced image correction features including Non-Uniformity, Defect, and Background Correction
- Extended operating temperature range: -20°C to +55°C (housing)
- Outstanding image quality with high dynamic range (up to >70dB)
- Comprehensive I/O Control options via optocoupled and non-isolated in- & outputs, or RS232

> Eiam

- Compact (~58 mm x ~59 mm x ~78 mm) Integrated Smart Vision System featuring System on Chip (SoC) architecture
- Integrated hardware acceleration supporting efficiently open neural networks such as Caffe, TensorFlow and MXNet
- Easy to use Open Camera Concept requiring no expertise in FPGA programming
- Support of all TEC-less IMX99x SenSWIR sensors, as well as UV (IMX487) and 5 MP Polarsens sensors (IMX264/250) from Sony
- Gigabit Ethernet interface including PoE+ support
- GenICam standard conformity
- Operating temperature: 0°C to 50°C
- Digital I/O control and power input

> FXO

- World fastest high-resolution SWIR and UV camera series in a compact industrial housing (50 mm x 50 mm)
- Support of Sony SenSWIR sensors (IMX990/992/993) optionally with thermoelectric cooling and UV (IMX487) sensors
- CoaXPress-12 for lowest latency and highest speed
- 1024 MB image buffer SDRAM
- 10 GigE for an easy integration
- Advanced image correction features including Non-Uniformity (Two-Point NUC), Shading, and Defect- and dynamic Hot Pixel Correction
- Support of GenICam and GenTL standards
- Up to 65°C operating temperature
- Electrical and optical inputs TTL-24V
- Power output (4-channel strobe controller) with 3A max
- Programmable timer and sequencer with Logical Trigger functions (PLC)

- Entry-level camera series with compact and robust industrial design (50mm x 50mm)
- Support of VGA and SXGA resolution TEC-less SenSWIR sensors (IMX991/990), as well as 5 and 12 MP Polarsens sensors from Sony (IMX264/250/253)
- Advanced image correction features including Non-Uniformity (Two-Point NUC), Shading, Defect- and dynamic Hot Pixel Correction
- Support of GenICam and GenTL standards
- 256 MB Burst Mode Buffer (GigE)
- Up to 65°C operating temperature
- Electrical and optical inputs TTL-24V including
- Power output (4-channel strobe controller) with 3A max
- Programmable timer and sequencer with Logical Trigger functions (PLC)

> allPIXA

> Corona II LED illumination

- Line Scan InGaAs sensors with 512 or 1024 pixels and 25µm x 25µm or 12.5µm x 12.5µm pixel size
- High speed: Up to 40 kHz line rate
- Compact size: 62 mm x 62mm x 52 mm
- GigE Vision
- On-board DSNU, PRNU, and LUT or Gamma correction
- Horizontal binning to increase responsivity
- Operating temperature: -10°C to +50°C
- Frequency converter for external line trigger
- Patented reflector technology
- Multiple wavelength ranges: UV, visible, NIR, SWIR
- Equal focussing of different wavelengths
- Higher efficiency compared to rod lenses
- High irradiation power even at longer working distances

> United Power for Your Vision Solution.

TKH Vision is a global group of machine vision technology leaders providing complementing 2D and 3D vision components and solutions. With a distinct customer-centric approach, the machine vision experts prioritize tailoring solutions to various customer needs, fostering enduring relationships built on trust and excellence.
